Document Body

James,
Here are a few comments on the above two documents. The ShawIT SAPA needs some clarifications, but otherwise looks ok. The MWH needs to reconsider its sampling strategy; contrary to one of their objectives, the soils data collected from 12" to 18" below the surface are highly dubious for doing risk assessments! If necessary and time critical before the end of the fiscal year, we could likely resolve the MWH issues on the phone.
